To address the challenge of charging/discharging EVs participating in wind power fluctuation mitigation, this paper proposes a coordinated integration of EVs fleet with uncertain wind power.

The aim is to discern the most efficacious techniques for optimizing charging stations.

This paper considers an electric vehicle charging station based on the combination of a wind turbine, as a primary power source, ...

An in-depth analysis of both the Base Case and the Proposed Case in the economic dynamics section offers a thorough insight into the financial effects that are related to the ...

This paper investigates the grid integration of a wind turbine (WT) and zinc-bromine flow battery (ZBFB) to power EV charging stations equipped with both AC slow and ...

This study presents a stochastic framework for optimizing wind-powered electric vehicle charging stations (EVCs) using minute-by-minute wind speed data from the National ...

To ensure optimal performance and stability, a sophisticated smoothening band charge controller has been developed. This controller enables seamless transitions between ...

An efficient charging station design with MPPT and current control technique is designed to ensure smooth power among solar, wind, and energy storage units and the electric vehicle in ...
