How can a mobile vehicle communicate with a base station?

The above graph shows the distance range between a mobile vehicle with a basic vehicle antenna, communicating with a base station using a basic antenna mounted on the roof of a suburban house. Communication distance can be greatly improved over this by advanced gain antenna systems or a high pole or a tower at the base station.

How do I start a base station setup?

Before starting a base station setup, the user needs to know and understand basic concepts of the base-rover setup. The location is the actual environment in which the base station will be installed. Typically, this means outside in an open sky environment (e.g. on the roof of a building or in an empty field).

Why are base stations important in cellular communication?

Base stations are important in the cellular communication as it facilitate seamless communication between mobile devices and the network communication. The demand for efficient data transmission are increased as we are advancing towards new technologies such as 5G and other data intensive applications.

Do I need a local base station?

So if the reference station is located too far or simply is absent in the area you will need a local base station. Other advantages of your own base are independence from the Internet connection and lack of NTRIP subscription fees.

Backhaul Connection: The backhaul connection links the base station to the core network in the mobile communication system. It provides for the interchange of data between ...

Radio signals from a base station propagate through space and are subject to path loss, attenuation, and scattering. As distance from the ...

In Table 1 are presented the minimum safe distances for GSM 900, GSM 1800 and 3G base stations, in terms of public and occupational exposure.

Based on factors such as base station construction cost, signal coverage, and Euclidean distance between base stations, this paper constructs a multi-objective planning and location model ...

Distance between communication generator and base station

One object of the invention is to provide an improved method for determining the distance between a base station and at least one mobile object.

Over large distances, the signals must be relayed by a communication network comprising base stations and often supported by a wired network. The power of a base station varies (typically ...

One of the determining factors in accuracy and reliability is the baseline (i.e. the distance between the rover and base receivers). For the differencing techniques, it is advised to keep the ...

Typically the distance between the reference station and local rover shouldn't exceed 10-15 km due to the ionospheric effect. So if the reference station ...
