Cooling solar cells towards ambient temperature is essential for photovoltaic conversion since the elevated temperature has significant ...

Cooling solar cells towards ambient temperature is essential for photovoltaic conversion since the elevated temperature has significant adverse consequences on the ...

Measured against windows assembled with ordinary clear glass, Solarban® 60 glass lessens solar heat gain by more than half. When the seasons ...

This figure illustrates the characteristics of a typical double-glazed window with a moderate-solar-gain low-E glass with argon gas fill. These windows are often referred to as spectrally selective ...

Argon gas is denser and therefore less conductive than air, and when sealed glass units are filled with argon gas, the convection within the airspace is significantly reduced, creating a better ...

Measured against windows assembled with ordinary clear glass, Solarban® 60 glass lessens solar heat gain by more than half. When the seasons turn cold, the high insulating value of ...

Combining the Warm-Edge Spacer System with multi-layered, vacuum deposition Low-E glass and Argon gas, the SolarZone(TM) glass package makes for a greener home.

Argon glass windows are those in which the double-pane in a window is filled with argon gas. Argon is a noble, dense, and colorless gas. These properties make it capable of ...
