Recent progress in Zn-air batteries is critically reviewed. Current challenges of rechargeable Zn-air batteries are highlighted. ...

The battery demonstrated stable operation at 200 mA cm<sup>-2</sup> over 250 cycles, highlighting its potential for energy storage applications.

Electrically rechargeable zinc-air flow batteries (ZAFBs) remain promising candidates for large-scale, sustainable energy storage. The implementation of a flowing ...

In this study, we focus on the design of semi-solid Zn-based anolyte and semi-solid Ni (OH)<sub>2</sub>-based catholyte and their use in static cells and flow batteries.

Project Description: Development of advanced Zn-air flow batteries with high energy and power density. Motivation: Zn-air has high intrinsic theoretical energy density.

A new approach for utilizing a Zn anode and an air cathode in a rechargeable alkaline zinc-air battery (ZAB) using a reversible two-electron bifunctional catalyst is presented.

A novel zinc-air flow battery system with high power density, high energy density, and fast charging capability is designed for long-duration energy storage for the first time.

The inherent slow kinetics of the ORR at air electrodes frequently constrains their operational efficiency. Here, we develop a new ...
